Figure 1 displays 12 histograms showing the distribution of the number of non-zero elements in the vector x for different values of n (10, 20, 30, 40, 50, 60, 70, 80, 90, 100, 110, 120). The x-axis is labeled 'x' and ranges from 0 to 120. The y-axis is labeled 'count' and ranges from 0 to 100. The distributions are centered around $x=60$ and become narrower as n increases.

Figure 1 shows the results of the first two experiments. In both cases, the mean values of the two groups were not significantly different. The standard deviations were, however, smaller in the control group than in the treated group. This is probably due to the fact that the control group was smaller than the treated group. The results of the third experiment are shown in Figure 2. The mean values of the two groups were not significantly different. The standard deviations were, however, smaller in the control group than in the treated group. This is probably due to the fact that the control group was smaller than the treated group.
